

archival

curated object registry

CREATED BY: KATE GALVIN
PRESENTATION DATE: APRIL 15, 2026

| **project description**

material registry

Archival acts as a comprehensive register of a user's treasured items, whether they be decor, music, books, or fashion. Users can record item information like creator, year of creation, photos, and associated movement. Items can be filtered and searched for from a centralized database.

analytical archive

Users can analyze their items using data visualizations including geographical distribution, movement distributions, and a temporal density graph. They can also organize items into custom collections and view items across a timeline to visualize the history of a collection.

| **core objectives**

One Organized Vault: Allow users to easily navigate their collections to add, update, and find item information.

Preference Analysis: Generate data visualizations that users can view to analyze their preferences in item movements, places of origin, and creators.

Historical Analysis: Create one continuous timeline for historical analysis that places items in context with each other by the year of their creation.

| project justification

Passion for Curation: My interest in this project stems from a desire to encourage mindful, slower consumption and a deeper appreciation of the things you already own. I also enjoy the process of created a gallery-like UI.

Technical Alignment: This project represents a convergence of my abilities in gallery-like user interfaces and full-stack software development, requiring both aesthetic cohension and complex data management.

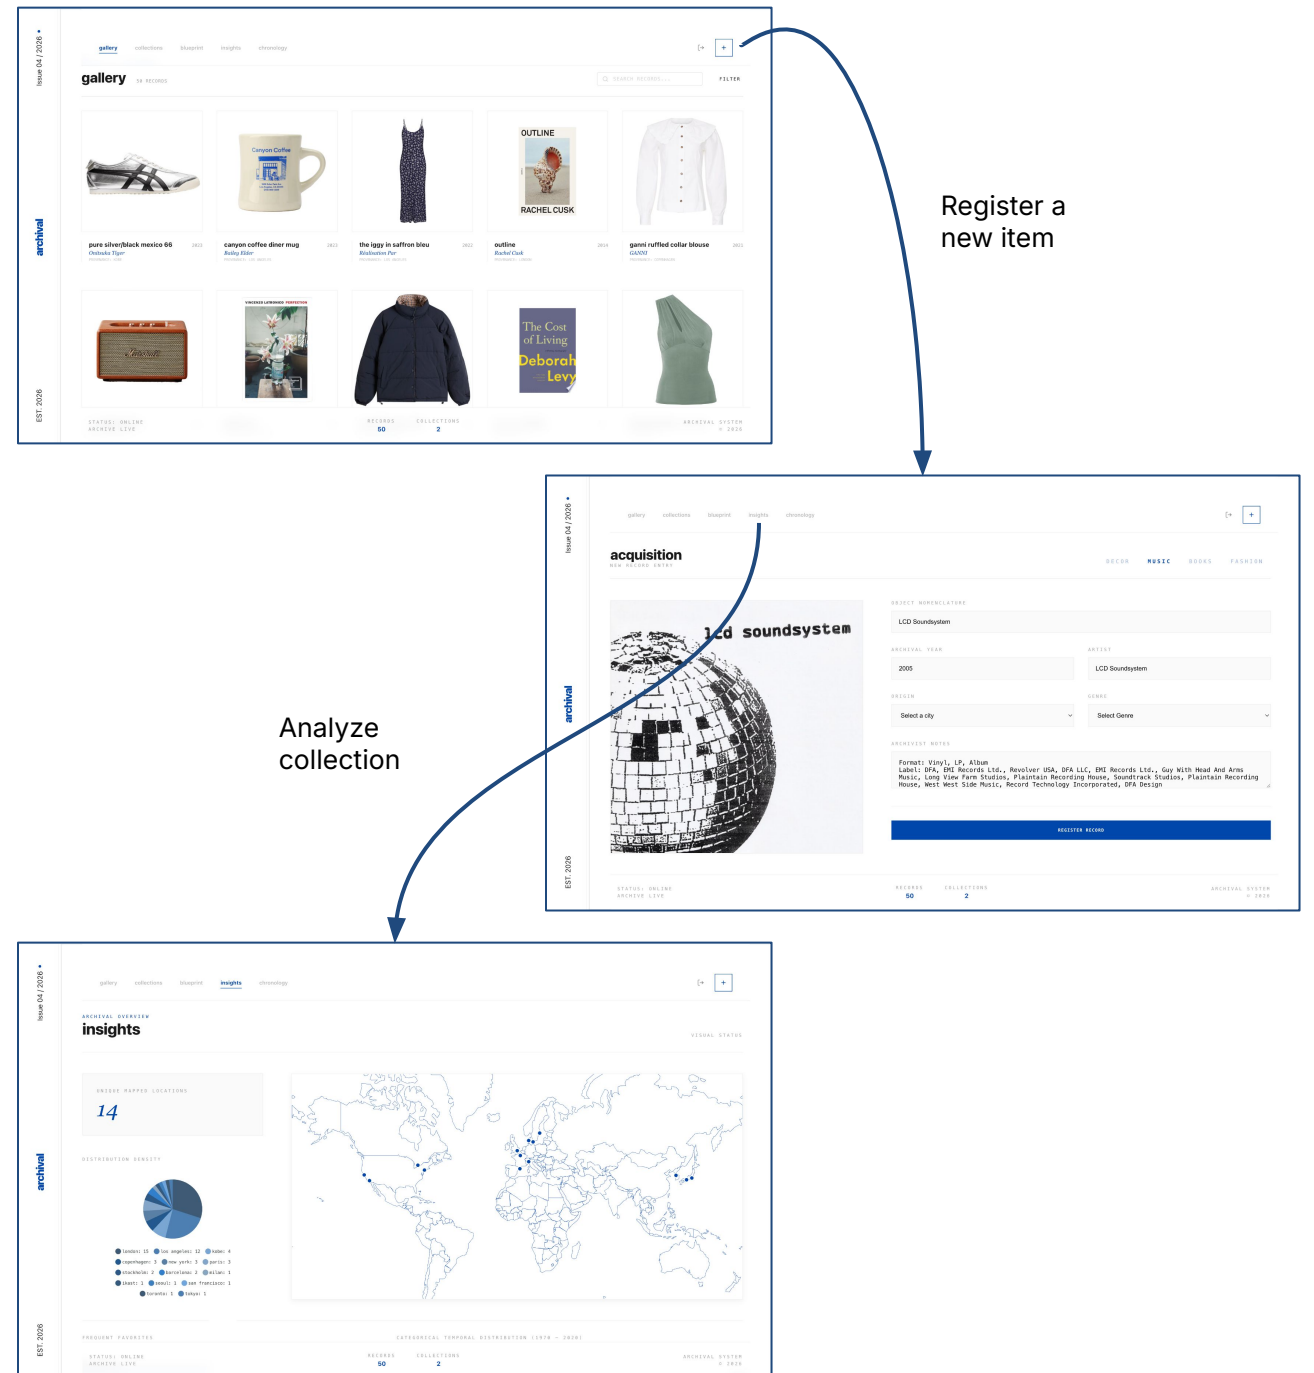

user interface

From the main gallery pages users can move around to:

- Create custom collections
- View rooms and assigned decor
- Analyze their collection
- View a timeline of item history
- Add new items
- View specific item information

The interface is minimalistic and simple in order to focus on the user inputted items.

live demo

| project challenges

books and music APIs

Determining the best free APIs to use for helping populate the item metadata on the registration page was difficult. I ultimately went with Discogs and Google Books, primarily for the album/book cover photos they supplied.

data visualizations

It took time to determine the most appropriate data visualizations for the insights page to display and how they should be implemented (a mix of ApexCharts, Leaflet, native HTML/CSS, and custom SVG).

status report

Archive Task	Status	Priority
Add clean login/signup process	Complete	High
Create flow for adding and editing items	Complete	High
Add collections, blueprint, and chronology pages	Complete	High
Create relevant data visualizations on insights page	Complete	High
Improve Documentation	In Progress	High
Add More Sophisticated Data Visualizations	Out of Scope	Low
